EZ-Volunteer System

System overview

EZ-Volunteer System keeps track of the volunteers at an organization, and how many hours each person has worked. Initially, organizations may handle such data in a spreadsheet, which works fine until the dataset grows. It runs on a web browser, so there is minimal setup required.

There are four functions available to the user: adding volunteers, adding hours, viewing hours, and generating a letter (on letterhead). Add a volunteer once, all you need is their name, phone number, and address. Log a shift after someone works it, with the date & time range. Look up anyone's total or generate a shift record, which schools ask for to prove hours.

The app exists to provide an organization with a mobile-friendly & efficient way to log shifts. A student who needs community service hours signed off can provide that document to whoever is asking for it. Shifts that run past midnight are counted properly, which is the kind of thing that quietly goes wrong in a spreadsheet.
